

Distinct redshift overlaps and actual numerical checks · page 6

● CCL QAG ■ CoCoA 96-node spectra — Normalized $n_i(z)n_j(z)$

Each distinct input/pair appears once. Red dashed line: 0.01%. Common-reference offsets include kernel/interpolation differences.

CoCoA: actual covariance-module spectra, with 96 vs 1024-node convergence. Selected pairs and targeted cases are not incidence samples.
