

A narrow overlap exposes false convergence

Deliberate stress test: 15% shared population at $z = 0.94087$, $\sigma z = 0.003$

$$w_0 = -1.038927, w_a = 0, \Omega_m = 0.3156 \cdot \text{lens bins } 4 \times 5 \cdot \ell = 355.656$$

CCL QAG: -78.75% error; GSL_SUCCESS after 41 evaluations.

CoCoA integration_accuracy: 0 $\rightarrow$ -0.520%; 2 $\rightarrow$ -0.00152%; 3 $\rightarrow$ -0.000241% (vs level 4).

Reference: refined CCL CQUAD, checked with subdivisions around the peak and twice as many input samples.

Common-reference CoCoA offsets: default -0.538%; refined -0.0176% (includes interpolation differences).

CoCoA covariance-module angular spectra, not ordinary data-vector integration. Targeted example, not a failure-frequency estimate.
