

# Distinct redshift overlaps and actual numerical checks · page 2

● CCL QAG    ■ CoCoA 96-node spectra    — Normalized  $n_i(z)n_i(z)$

Each distinct input/pair appears once. Red dashed line: 0.01%. Common-reference offsets include kernel/interpolation differences.

CoCoA: actual covariance-module spectra, with 96 vs 1024-node convergence. Selected pairs and targeted cases are not incidence samples.
