

shared_narrow_peak · lens bins 2 × 2: overlap and actual spectra

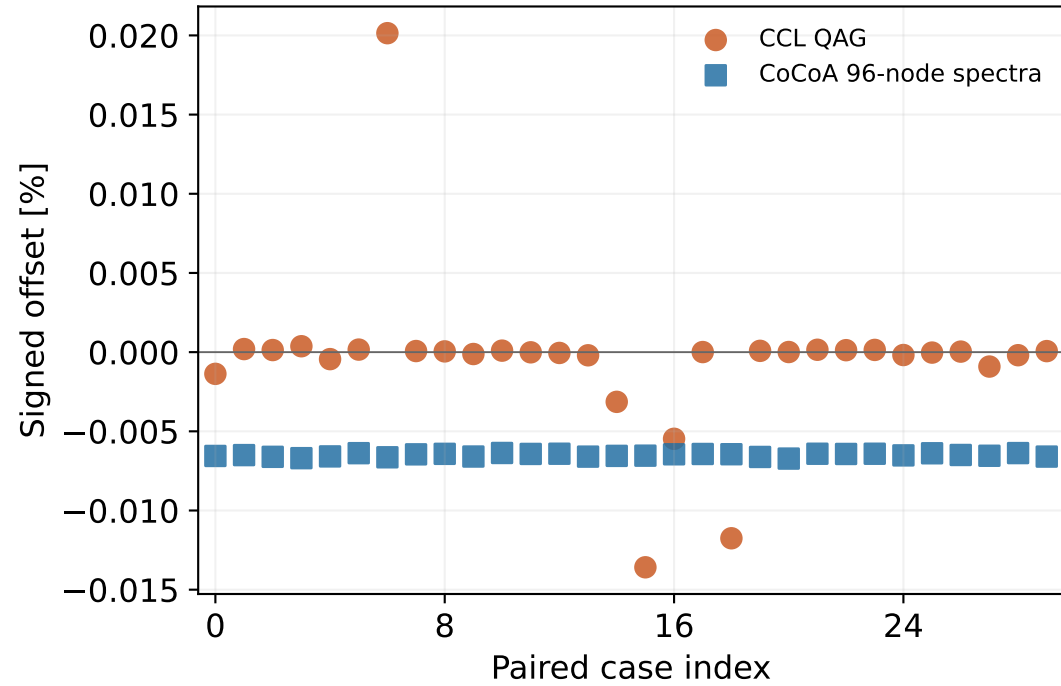

The redshift product is identical across cosmologies; changing cosmology changes its distance mapping.

Common-reference offsets include kernel/interpolation differences. Own-code convergence isolates quadrature resolution.

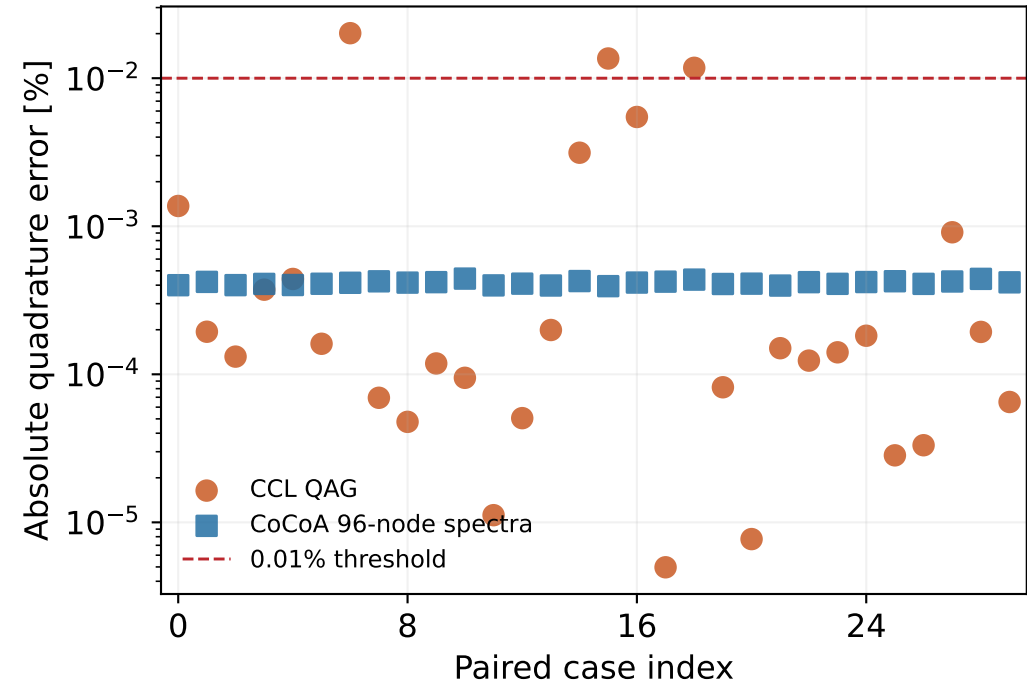

Shared input and its overlap

Both codes vs CCL CQUAD

Each code vs its own refinement

30 paired cases; 0 unresolved. Selected secondary pairs and targeted points are diagnostic, not incidence samples.

CCL reference: successful checked CQUAD refinements. CoCoA reference: 1024 nodes/panel, checked against 512.

CoCoA points are actual covariance-module spectra. Any CoCoA underresolution is retained. Redshift curves are drawn once per input/pair.
