

A narrow overlap can fool an adaptive error estimate

Unmodified CCL: 41-point and 20-point estimates agree, but both are 4.0225% low

Two broad bins make a narrower product

The first CCL pass misses the top of the peak

CCL 3.3.3 / GSL 2.7 · $\ell = 355.655882$ · $w_0 = -1.03892727$ · bins 4×5 (one-based) · frozen PR #1313 inputs

CoCoA covariance-module spectra: 7 panels $\times$ 96 nodes in a; default / refined $-1 = -0.0016\%$. No covariance matrix computed.

Inside the shaded half-maximum width: 2 Kronrod nodes (1 shared Gauss) versus 55 configured CoCoA nodes.
