

CCL 3.3.3 · GSL 2.7 ·  $\ell = 355.655882$  · lens bins  $4 \times 5$  (one-based)  
 $w_* = -1.0389272676$ ; all other cosmology and survey inputs fixed

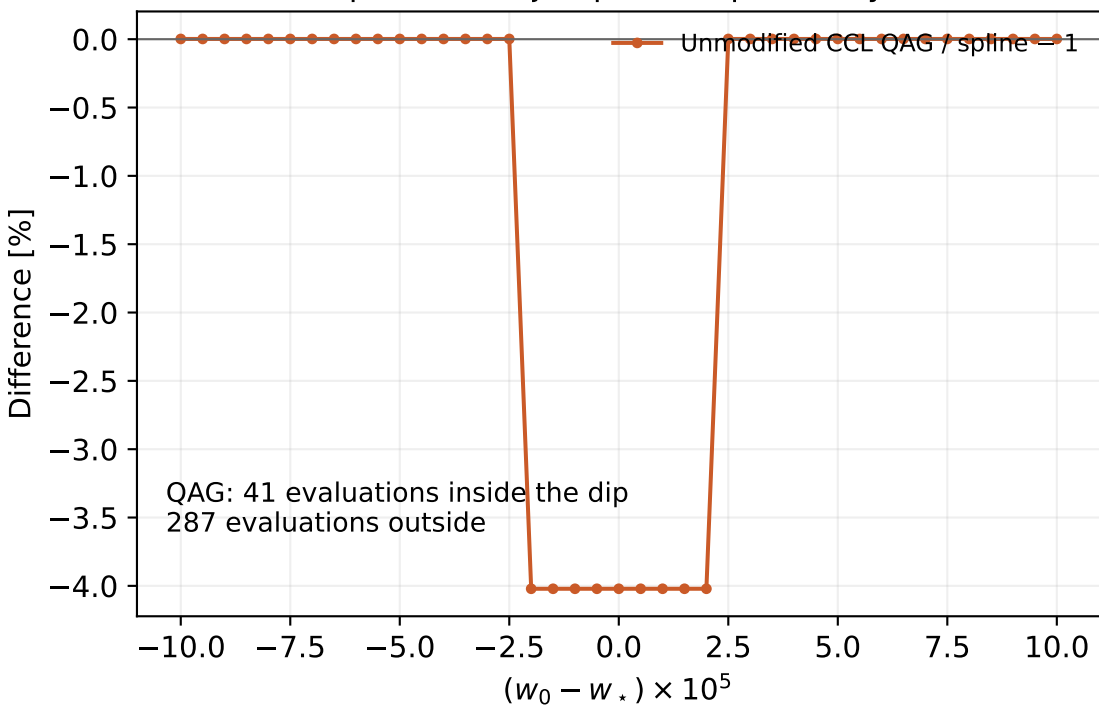

Fixed redshift distributions: narrow overlap + tails

First pass: nodes miss the top of the peak

The accepted result jumps; the spline stays smooth

Accidental rule agreement defeats the error estimate
